

Tuning in to the Needs of Families

Practice having effective, family-centered conversations related to:

- Child Development
- Maternal Depression
- Social Determinants of Health

These interactive simulations enable you to practice having effective, family-centered conversations in a clinical setting. The techniques in these simulations can be practiced and used throughout the screening process by various members of health care teams. CME and MOC Part II available.

Connect with the family and use shared decision making, empathy, and strengths-based approaches to help address their identified needs.

Maternal Depression

Child Development

Social Determinants of Health

Join baby Leo and his parents, Gina and Mike at their well-child visits from birth to age 3.

- Engage mom, Gina and dad, Mike in a conversation about maternal depression at the 2- month well-child visit.
- Along with the family, discuss the expressive language delay identified through the use of a developmental screen.
- Address food security concerns identified in the social determinants of health screener used at a well-child visit.
